# Workshop

Department had organized 15 days workshop on Android and Python Programming for Third Year Student and PHP programming for Second Year Students in collaboration with "TechWings International IT Solutions". The main motive while arranging such workshop is to bridge gap between Academics and Industry

26th JAN 2023

#### **Robotic Process Automation**

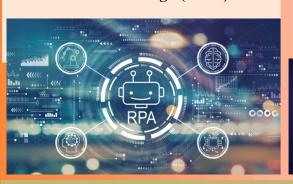

Robotic process automation (RPA) is

a form of business process automa-

tion technology based on metacal software robots (bots) or on artificial intelligence (AI)/digital workers.It is sometimes referred to as software robotics (not to be confused with robot software).In traditinal workflow automation tools, a software developer produces a list of actions to automate a task and interface to the back end system using interal application programming interfaces (APIs) or dedicated scripting language. In contrast, RPA systems develop the action list by watching the user perform that task in the aplication's graphical user interface (GUI). and then perform the automation by repeating those tasks directly in the GUI. This can lower the barrier to the use of automation in products that might not otherwise feature APIs for this purpose.RPA tools have strong technical similarities to graphical user interface testing tools. These tools also automate interactions with the GUI, and often do so by repeating a set of demonstration actions performed by a user. RPA tools differ from such systems in that they allow data to be handled in and between multiple applications, for instance, receiving email containing an invoice, extracting the data, and then typing that into

#### IN THIS ISSUE >>> Message of HOD

It is our pleasure to present News Letter "TANTRA" of our department. This news letter is one of the ways in which we can disseminate the information about our department. The past semester was full of various activities by the students and faculty in Academic, Co-curricular and Extracurricular activities. As you read through pages, vou will realize that we have succeed in academics as well as in different co-curricular activities.

-Mr. G.S. MISAL

# **Department Vision**

**P3** 

**P4** 

To be recognized one among the premier Information Technology department in Maharashtra to empower the capabilities of students in education with professional ethics enabling students to reach higher goals in the field.

# **Department Mission**

- To impart value based Technical Education in Information Technology.
- To support for technical knowledge of students in the field of Information Technolo-
- . To make the students efficient in various skill Sets in Information Technology.
- To encourage students for lifelong learning.

#### Quantum computing

**Quantum computing** is a type of computation whose operations can harness the phenomena of quantum mechanics, such as superposition, interference, and entanglement. Devices that perform quantum computations are known as quantum computers. Though current quantum computers may be too small to outperform usual (classical) computers for practical applications, larger realizations are believed to be capable of solving certain computational problems, such as integer factorization (which underlies RSA encryption), substantially faster than classical computers. The study of quantum computing is a subfield of quantum information science. There are several models of quantum computation with the most widely used being quantum circuits. Other models include the quantum Turing machine, quantum annealing, and adiabatic quantum computation. Most models are based on the quantum bit, or "qubit", which is somewhat analogous to the bit in classical computation. A qubit can be in a 1 or 0 quantum state, or in a superposition of the 1 and 0 states. When it is measured, however, it is always 0 or 1; the probability of either outcome depends on the qubit's quantum state immediately prior to measurement. One model that does not use gubits is continuous variable quantum computation. Efforts towards building a physical quantum computer focus on technologies such as transmons, traps and topological quantum computers, which aim to create high-quality qubits.

Vaishnavi Koli (TY-IF)

#### Internet of Things (IOT)

The Internet of things (IoT) describes physical objects (or groups of such objects) with sensors, processing ability, software and other technologies that connect and exchange data with other devices and systems over the Internet or other communications networks. Internet of things has been considered a misnomer because devices do not need to be connected to the public internet, they only need to be connected to a network and be individually addressable. The field has evolved due to the convergence of multiple technologies, including ubiquitous computing, commodity sensors, increasingly powerful embedded systems, as well as machine learning. Traditional fields of embedded syssensor networks, control wireless tems, automation (including home and building automation), independently and collectively enable the Internet of things. In the consumer market, IoT technology is most synonymous with products pertaining to the concept of the "smart home", including devices and appliances (such as lighting fixtures, thermostats, home security systems, cameras, and other home appliances) that support one or more common ecosystems, and can be controlled via devices associated with that ecosystem, such as smartphones and smart speakers. IoT is also used in healthcare systems. There are a number of concerns about the risks in the growth of IoT technologies and products, especially in the areas of privacy and security, and consequently, industry and governmental moves to address these concerns have begun, including the development of international and local standards, guidelines, and regulatorv frameworks
